Genesis Biotech – Multi-site Biogas Initiative, Romania

Key Project Information

Project Description

Genesis Biotech SRL is a company dedicated to innovation and sustainability in biotechnology. For our certification project, we are proud to present the initiative of producing electricity and heat from renewable sources. This project demonstrates our commitment to using renewable resources while reducing carbon emissions.

The project aims to recover organic waste and produce electricity and heat, thus contributing to a cleaner and more sustainable environment. Genesis Biotech is committed to the highest standards of quality and efficiency, ensuring that every stage of the project is carried out to Gold Standard regulations.

The project is currently in the process of certifying its carbon credits to achieve Gold Standard international accreditation. It uses innovative methods to quantify, certify and maximise impacts on climate security and sustainable development. The criteria set by the international Gold Standard organisation are aligned with the UN Sustainable Development Goals.

What is the aim of Gold Standard certification?

The project is currently going through a Carbon Credit certification process to adhere to the international 'Gold Standard' accreditation, which utilizes innovative approaches to quantify, certify and maximize impacts towards climate security and sustainable development under Gold Standard for the Global Goals, and it is aligned with the United Nations Sustainable Development Goals.

Upon successfully finalizing its Gold Standard certification, Genesis Biotech SRL is aiming to receive carbon credits in an equal amount with the certified CO2 emissions reductions achieved by the following projects activities localized in:

Plant 1, location Cordun, Neamt county: The total GHG emission reductions for the 15 years crediting period (2024-2038) are estimated at 645,000 tCO₂e, and the annual average GHG emission estimation is around 43,000 tCO₂e.

Plant 2, location Pischia, Timis county: The total GHG emission reductions for the 15 years crediting period (2025-2039) are estimated at 645,000 tCO₂e, and the annual average GHG emission estimation is around 43,000 tCO₂e.

SC GENESIS BIOTECH S.R.L part of Genesis Biopartner

Nr. Reg. Com. J29 /326/ 2011 · C.U.I. RO 28130620

Puncte de lucru: Str. Uzina de Țevi nr. 19B · 617135 Cordun · Județul Neamț
Strada Gării nr. 660L · 107245 Filipeștii de Pădure · Județul Prahova

Adresa: Strada Bruxelles nr. 877A · 107025 Ariceștii Rahtivani · Județul Prahova · România

Banca: Banca Transilvania SA · IBAN: RO33 BTRL RON CRT 039 7151 401

Plant 3, location Almaj, Dolj county: The total GHG emission reductions for the 15 years crediting period (2025-2039) are estimated at 645,000 tCO₂e, and the annual average GHG emission estimation is around 43,000 tCO₂e.

Gold Standard Certification Timeline

The project is expected to pass the Gold Standard preliminary review by the fall of 2024 and continue the certification process during 2024 with the aim to receive carbon credits at the end of 2025. After that date, the project will receive CO₂ credits for a 5-year cycle, renewable 3 times, upon passing all verification process.

Project Location

The project activity is located in three locations in Romania.
The address and the GPS coordinates for the plants are:

- **Plant 1**

Address : 19B, Uzina de Tevi, Cordun commune, Cordun village, Neamt county
GPS: 46.96807, 26.88398

- **Plant 2**

Address: Cadastral No. 407294, Pischia, Timis county
GPS: 45.885155, 21.360096

- **Plant 3**

Address: Cadastral No. 31765, Almaj, Sitoaia village, Dolj county
GPS: 44.416555, 23.716607

Project Timeline Implementation

Plant 1: The Project's first tender for the acquisition of the major equipment was in Summer 2023, which is considered the start date of the project, according to Gold Standard rules and requirements. Then, the final commissioning of the facility is estimated to be in late Summer 2024, starting its commercial operation in Fall of 2024.

Plant 2: The Project's first tender for the acquisition of the major equipment started in late Spring 2024, marking the start date of the project as per Gold Standard rules and requirements. The final commissioning of the facility is estimated for Summer 2025, with commercial operations expected to begin in Fall/Winter 2025.

Plant 3: The Project's first tender for the acquisition of the major equipment is anticipated for early Autumn 2024, which will mark the start date of the project according to Gold Standard rules and requirements. The final commissioning of the facility is estimated for early Winter 2025, with commercial operations projected to commence in late Winter 2025.

Baseline Scenario

For all project is applicable the same baseline scenario taking into account the technologies used in the projects.

As per the UN CDM methodology applied to assess emissions savings, for renewable energy technologies substituting the energy used from the national grid, the simplified baseline involves multiplying the quantity of the electric energy consumption of the

technologies that would have been utilized in the absence of the project by an emission factor for the displaced electric energy from the grid and for the emissions the second was the quantity of the Methane emissions that would have been released in the atmosphere in the absence of the project from the fresh waste.

In our specific context, the baseline scenario for biogas and electricity production in the absence of the project activity is as follows:

- Electricity is sourced from the national grid.
- Methane (CH₄) emissions from fresh waste are released into the atmosphere from landfills.

Major Project Benefits

Our project aims to tackle two critical issues simultaneously: food waste and energy production. By partnering with supermarkets and other companies, we're implementing a sustainable solution to convert their fresh waste into valuable biogas through anaerobic digestion.

Key Components:

1. **Waste Collection System:** Establishing a streamlined process for collecting fresh waste from supermarkets and other relevant businesses. This includes developing partnerships, setting up collection schedules, and ensuring compliance with health and safety regulations.
2. **Anaerobic Digestion Facility:** Constructing or retrofitting a facility equipped with anaerobic digesters. These digesters will break down organic matter from the collected waste in an oxygen-free environment, producing biogas as a byproduct.
3. **Biogas Refinement:** Implementing systems to refine the biogas produced to meet quality standards suitable for various applications. This may involve removing impurities such as hydrogen sulfide and carbon dioxide, as well as compressing or liquefying the biogas for transportation and storage.
4. **Energy Generation and Utilization:** Utilizing the biogas as a renewable energy source for electricity generation, heating, or as a vehicle fuel. This energy can be used onsite or sold back to the grid, contributing to local energy independence and reducing greenhouse gas emissions.
5. **Waste Residue Management:** Managing the digestate residue left after the anaerobic digestion process. This residue can be used as a nutrient-rich fertilizer for agricultural purposes or converted into other value-added products, closing the loop on the waste-to-energy cycle.

Benefits:

1. **Environmental Impact:** Reducing greenhouse gas emissions by diverting organic waste from landfills, where it would otherwise decompose and release methane, a potent greenhouse gas. Additionally, generating renewable energy displaces the need for fossil fuels, further mitigating environmental harm.
2. **Economic Opportunities:** Creating jobs in waste collection, processing, and energy generation sectors. Moreover, by monetizing waste through biogas production, participating businesses can potentially offset waste disposal costs and generate additional revenue streams.
3. **Social Responsibility:** Demonstrating a commitment to sustainability and corporate social responsibility by actively addressing food waste and contributing to renewable

energy production. This can enhance brand reputation and foster positive relationships with customers and communities.

4. **Energy Security:** Diversifying energy sources by integrating renewable biogas into the energy mix, reducing dependency on finite fossil fuels and volatile energy markets.
5. **Circular Economy:** Promoting a circular economy model by converting waste into valuable resources, closing the loop on the waste stream and creating a more sustainable and resilient ecosystem.

Overall, our project not only offers an innovative solution to the pressing issues of food waste and energy production but also embodies the principles of sustainability, resource efficiency, and environmental stewardship.

Therefore, the project contributes to the following United Nations Sustainable Development Goals:

1. **SDG 4: Quality Education** - The project can indirectly contribute to Goal 4 by raising awareness and promoting education on sustainable waste management practices, renewable energy technologies, and agricultural sustainability within the community.
2. **SDG 5: Gender Equality** - The project will ensure equal opportunities for both men and women in employment, decision-making processes, and benefit sharing.
3. **SDG 7: Affordable and Clean Energy** - The project promotes the use of biogas as a renewable energy source, aligning with the goal of ensuring access to affordable, reliable, sustainable, and modern energy for all.
4. **SDG 8: Decent Work and Economic Growth** - The creation of new jobs in waste collection, processing, and energy generation sectors contributes to the goal of promoting sustained, inclusive, and sustainable economic growth, full and productive employment, and decent work for all.
5. **SDG 12: Responsible Consumption and Production** - By reducing food waste and converting it into valuable resources (biogas and digestate), the project supports the goal of ensuring sustainable consumption and production patterns.
6. **SDG 13: Climate Action** - The project helps mitigate climate change by reducing methane emissions from decomposing organic waste in landfills and displacing the use of fossil fuels with renewable biogas.
